The author uses the following sayings: "What prevents you?", which
encourages positive behavior. She also emphasizes that
positivity can become the strength of every life stage at the present point.
She adds that those statements should be repeated more often in different situations, it will
lead to positive results. In addition, author highlights common sayings: "There are difficulties",
"There are losses", "We have power by ourselves", "There is no problem", "We have the
possibility", "there is no difficulty", "We cannot do nothing", "We possess all variety".

The following topics will be covered during the course: basic concepts of quantum mechanics; wave mechanics; Schrödinger's equation; atomic orbitals; molecular orbitals; valence bond theory; molecular orbital theory; and the periodic table.

However, there are no significant differences between the two groups in terms of age or sex, and no significant difference in the proportion of patients with comorbidities between the two groups.

Language is also used to express the relationship between the two concepts of time. Therefore, it is important to understand the concept of time in order to fully appreciate the meaning of the language.

Assumption on the behavior of the set of points of interest that are connected by a set of paths along the network. Specifically, you let Θ_{obs} represent the set of all the paths that connect different nodes in the network. Then, in order to estimate the flow along each path, you introduce an RNN. However, depending upon which flow you believe you have, the RNN will produce different results. This is because the RNN takes the flow information from the other nodes as input. So, if you assume that the flow along a path is zero, then the RNN will ignore it and focus on the other paths.

In the following sections we will discuss the main features of the proposed model and its implications for the study of the evolution of the Earth.
